Figure 1 Sensitivity Temperature Dependence

Figure 1 shows the variation in sensitivity caused by changes in temperature.

This data is taken from a typical batch of NO₂-D4 sensors. Good repeatability means accurate temperature compensation.

Figure 2 Zero Temperature Dependence

Figure 2 shows the variation in zero output caused by changes in temperature, expressed as ppm gas equivalent, referenced to zero at 20°C.

This data is taken from a typical batch of sensors.

Figure 3 Repeated gassing with 20ppm NO₂

This hysteresis graph shows stable response when gassed repeatedly with 20ppm NO₂.

Note: Above 85% rh and 40°C a maximum continuous exposure period of 10 days is warranted. Where such exposure occurs the sensor will recover normal electrolyte volumes when allowed to rest at lower %rh and temperature levels for several days.
